BARGE OPERATOR ACCESS

Although safe barge and handling equipment access is an essential part of any barge handling operation, the mere proximity of these units to water creates a potential safety threat to personnel, especially during inclement weather or times of poor visibility. Well aware of these potential hazards, IEC has utilized its design ingenuity to develop a full complement of barge and equipment access products that not only minimize the threat of danger, but maximize safety and working convenience for operations, maintenance and close up-emergency personnel.

PRODUCTS / SYSTEMS

Interstate **Bridges and Walkways** are custom designed to provide safe, direct access between floating dock barges, equipment, moored vessels and shore side support facilities. Gangways also feature a hinge and roller system for automatic river level adjustment.

IEC's custom designed **Stairways and Towers** are also built to maximize safety and convenience, meet all applicable code requirements, and provide all the inherent benefits of heavy-duty steel construction for maximum longevity.

The **IEC Portable Barge Access Ladder**[®] is rapidly gaining acceptance because they're designed to straddle the coaming of hopper barges, and provide the safest way to enter hopper barge holds without hazardous climbing.

[®]IEC Portable Barge Access Ladder is registered in the U.S. Patent and Trademark Office by Interstate Equipment Corporation. Patent 7,637,350
